BUSINESS COMMUNICATION

COMMUNICATION MODEL

BBA 2106

Nature of Communication Model

- Model refers to the representation of a process, an event or a situation. It does not show the details message, rather it only represent the elements which is the reason of sending the message.

- **Communication Model**

  A model of communication is a symbolic representation of the communication process.

- **According to W.R. Tracy,**

  " Communication model is representation of a communication process and not any separate system; rather a simple way to present the various objective oriented events".

Types of Communication Models

- Several models have been identified by communication theorists. All models include at least three elements:

⇨ ***A receiver***

⇨ ***A massage,***

⇨ ***A source.***

There are some communication models, each giving a little different perspective.

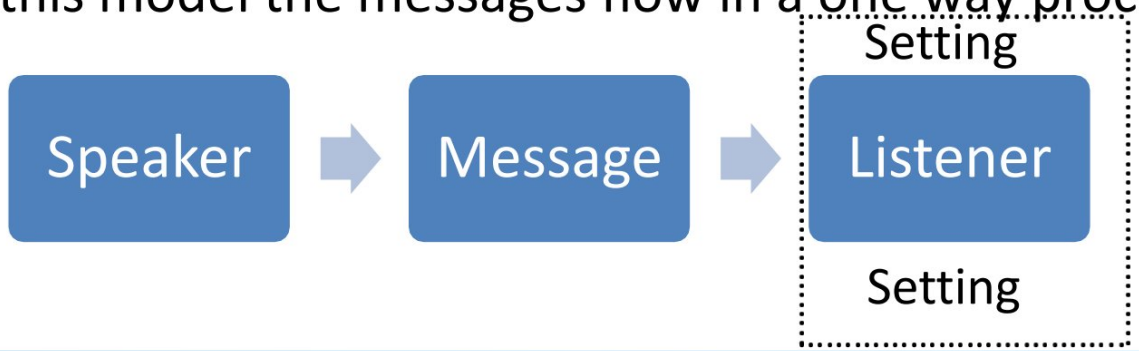
Types of Communication Models

❶ Aristotelian Persuation Model

It is the oldest and simplest model of communication. According to Aristotle- "The form of communication is persuasive in nature." This model does not include all the elements of communication. It includes only three elements of communication such as

- Speaker,
- Message, and
- Listener/Receiver.

In this model the messages flow in a one way process.



Types of Communication Models

❷ Hovland model of Communication

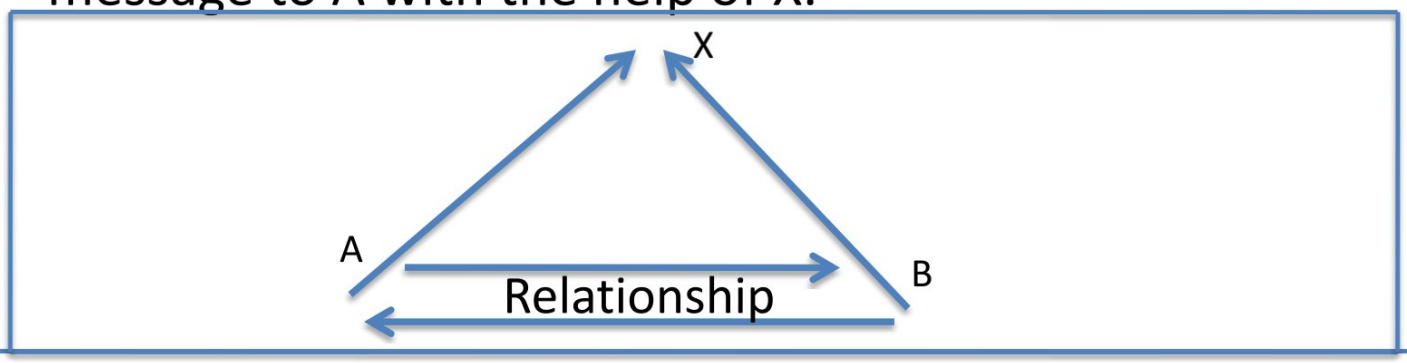
This model of communication is almost similar to Aristotelian persuation model, the only difference is that in Hovland model the listener will be in a pre-determined position. According to Hovland, the message is sent to a pre-determined listener and the listener also gives his reaction to the speaker.

Types of Communication Models

❸ The Newcomb Interpersonal Model

the Newcomb interpersonal model is one of the simplest models of communication. Newcomb advocate that "communication between the sender and the receiver takes place through a third person."

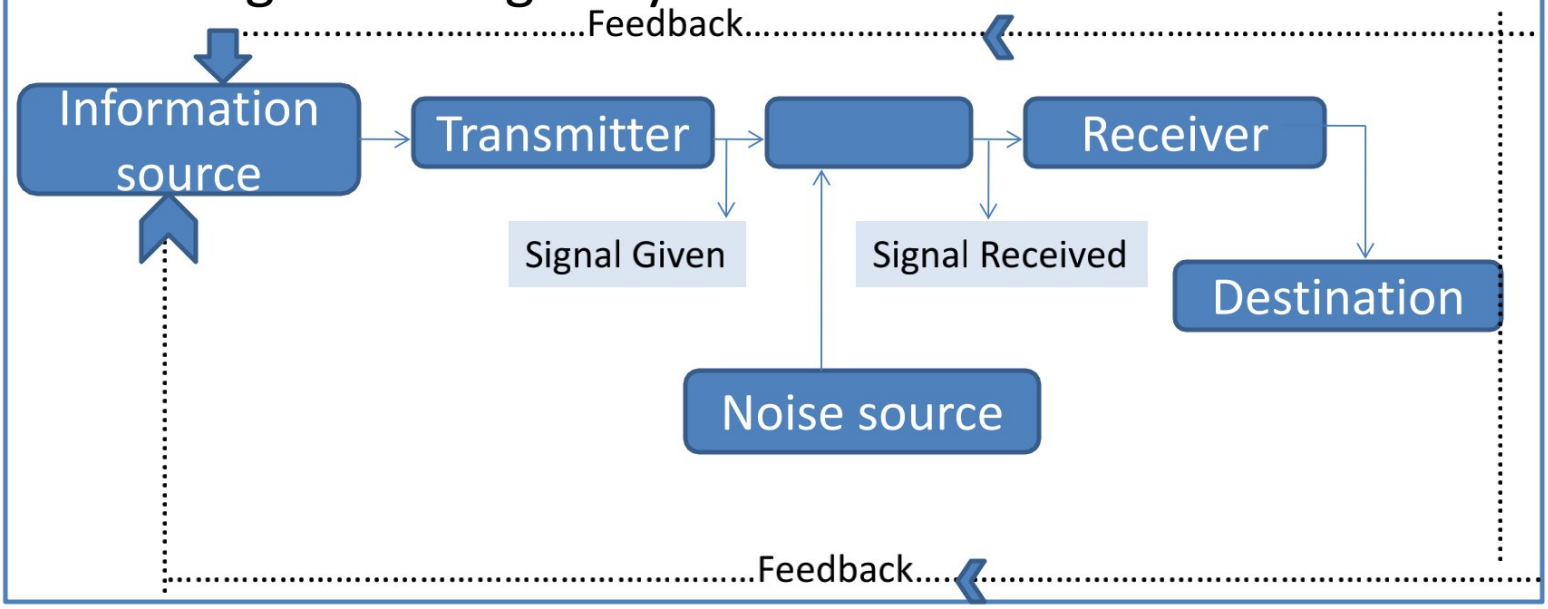
Suppose, A wants to communicate a message to B. But B is not known to him. Another person X is known to both A and B. Hence, A will communicate the message to B through the help of X. And also B will communicate message to A with the help of X.



Types of Communication Models

❹ Shanon and Weaver's information theory Model

This model involves an information source which selects a desired message, a transmitter which changes the message and it is sent through some communication channel to a receiver to whom the message was originally intended.



Types of Communication Models

➢ A noise source means any interference with the transmission and reception of the message. The noise may be two types:

⇨ **Mechanical Noise:**

- It comes from any mechanical source.

⇨ **Semantic Noise:**

- Difference between the meaning intended by the sender and the receiver of the message.

Types of Communication Models

❺ **Collin's and Guetzkuw's group Communication Model:**

It deals with communication in the decision making group which occurs as basic part of organizational communication.

- In below the top three boxes represent the source, behavior, and reward associated with the task aspects of group operation, while the lower three boxes represents the source, behavior and reward associated with interpersonal aspects of group operation.
- Obstacle in the task environment and interpersonal environment affects the group's interpersonal communication behavior.
